Product Decision Review

Use this review to see what the evidence supports, what remains uncertain, and what to verify before relying on Parseur - either for your organization or on behalf of a client.

BUYER QUESTION

Can an accounting user normalize differently formatted Japanese invoices and receipts with one field setup, including a required zero when no 8% tax amount appears?

INSIDE

Executive Decision Brief · Decision Evidence Matrix

EVIDENCE BOUNDARY

This sample reinterprets an existing IC Eight evaluation for a hypothetical buyer question. No new product test was conducted. For due diligence, it contributes product-level evidence and does not replace wider legal, security, financial, technical, or commercial review.

EXECUTIVE DECISION BRIEF

Parseur

IC Eight · Product Decision Review · Public sample

BUYER QUESTION

Can an accounting user normalize differently formatted Japanese invoices and receipts with one field setup? For this experiment, the hypothetical buyer specifies ten output fields and a rule to return zero when no 8% tax amount appears. This is not a real customer request.

DECISION DIRECTION

Reusable normalization is demonstrated. Output completeness remains qualified.

DEMONSTRATED VALUE

- One unchanged ten-field schema covered five first-use documents and two unseen variations without a new template for each layout. [1]
- The seven synthetic Japanese documents varied in layout, wording, field position, document type, and tax presentation. [1]
- P01 returned 45 of 50 target fields and P02 returned 17 of 20. All 62 returned values matched their sources; no nonblank target value was wrong. [1, 2]
- Both tax amounts matched in the mixed-tax example. [2]

CONDITIONS ON RELIANCE

- The fixed comparison covered seven documents and ten target cells per document. Of 70 cells, 64 matched the frozen ground truth, including two correctly blank due dates. [2]
- The remaining six cells required zero because no 8% tax amount appeared. They were blank without an exception warning. [2, 3]
- The same blank cell could represent either a legitimate absence or an unmet instruction. Correct returned values did not guarantee complete output. [3]
- CSV delivery worked through Explore data after all columns were shown. The initial Export-page request was blocked in Chrome, and the grid otherwise exported only visible columns. [4]
- Human review should retain completeness checks, exception interpretation, and approval of the final handoff.

UNVERIFIED

- Real customer documents, image-only scans, production volume, or long-running batches. [6]
- Resolution of the zero-default issue through another configuration, post-processing, or validation remedy. [5]
- General export reliability, labor savings, ROI, or hands-off accounting automation. [4, 6]
- The observed scope was seven synthetic, one-page, text-bearing documents on a Free account; AI Vision v3 was active and Force OCR was off. [6]

NEXT VALIDATION

- Test the unchanged schema on representative customer layouts with explicit expected outputs.
- Verify zero-versus-blank handling, visible exception behavior, and the intended CSV export route.
- Where relevant to the purchase, test real documents, image-only scans, intended volumes, and complete workflow time.

DECISION EVIDENCE MATRIX

Parseur

IC Eight · Product Decision Review · Public sample

This companion to the Executive Decision Brief connects five buyer evaluation questions to the published evidence behind its judgments. The ten-field schema and zero-default rule are experiment-specific criteria.

Status indicates support for each question. Demonstrated = supported within the tested scope. Qualified = partial or condition-dependent support. Unverified = not established by this evaluation.

Evaluation question	Observed evidence	Decision meaning	Further validation
1. Can one field setup normalize varied invoice and receipt layouts? **Demonstrated**	One unchanged ten-field schema covered five first-use documents (P01) and two unseen variations (P02), without a new template per layout. Layout, wording, field position, receipt format, and tax presentation varied. [1]	Supports the Brief's core normalization judgment within this set. Reuse across all Japanese invoice layouts is not established.	If broader layout coverage matters to the purchase, test the unchanged schema on representative customer layouts.
2. Do returned nonblank target values match their sources? **Demonstrated**	P01 returned 45 of 50 target fields and P02 returned 17 of 20. All 45 and 17 returned values matched their sources. No nonblank target value was wrong in the all-columns CSV. Both tax amounts matched in one mixed-tax example. [1, 2]	Supports correctness of the values returned in this test. It does not settle missing-field handling or establish general accuracy.	If source-value matching is purchase-critical, compare buyer-relevant samples with explicit expected values and assess omissions separately.
3. Does output meet the requested completeness and zero-default rules? **Qualified**	Fixed CSV comparison: seven documents and ten target cells per document. Of 70 cells, 64 matched the frozen ground truth, including two correctly blank due dates. The remaining six cells required zero because no 8% tax amount appeared. They were blank without an exception warning. [2, 3]	The completeness criterion was unmet. Silent default omissions explain the Brief's qualification despite correct nonblank values. 64 of 70 is a fixed-cell result, not a general accuracy rate.	If defaults are required, verify zero-versus-blank handling and visible exceptions in the intended configuration. No post-processing or validation remedy was demonstrated. [5]

Evaluation question	Observed evidence	Decision meaning	Further validation
4. Can CSV carry all requested fields? **Qualified**	The initial Export-page CSV request was blocked in Chrome. Explore data later worked but exported only visible columns. After all columns were shown, CSV contained seven rows, 15 mailbox columns, and all ten target fields. [4]	CSV delivery was demonstrated through one route; completeness depended on grid visibility. General export reliability and automatic completeness remain unestablished.	If CSV is the handoff, verify the intended export route and compare the final CSV headers with the full required-column list.
5. Do the results establish fit for real documents, image-only input, and production volume? **Unverified**	Only seven synthetic, one-page, text-bearing Japanese documents were tested on a Free account. AI Vision v3 was active; Force OCR was off. No real customer documents, raster-only OCR, production volume, or long-running batches were tested. [6]	Production fit remains open. The evidence does not establish labor savings, ROI, or hands-off accounting automation.	Where relevant to the purchase, test real documents, image-only scans, and intended volumes. If labor savings matter, measure complete workflow time.
