

OPERATIONS BRIEFING — OPPOSITE SIDE OF MARKET

PROXY ONLY — NO OCCUPANCY OR PROFITABILITY

N = 42,378 · 15,849 HOSTS

Which neighbourhoods show the strongest *demand signals* — and how to use that safely.

All “strength” below is inferred from **review activity and calendar availability** inside listings.csv. Review counts are a **proxy for bookings**; availability is a **proxy for calendar tightness**. Neither equals occupancy, ADR, or profit. Use to prioritize where to validate with booking data.

- City medians: 7 reviews LTM · 314 days availability · 331 listed price
- Best median reviews LTM: Sé 17 · Santana 16 · Brás & Barra Funda 13
- Tightest calendar (≥100 listings): Santana 238 days · Santo Amaro 274 · Consolação 280

STRONGEST PROXY DEMAND

Sé — 17 LTM

517 listings · 2.53/m · 94% entire homes

BEST BALANCE OF TIGHTNESS + REVIEWS

Santana — 16 LTM

571 listings · 238d median avail · tightest in city (≥100)

SCALE + STRENGTH

República 3,711 · 10 LTM

Largest pool with above-city-median demand proxy

VALUE TILT

Brás / Tucuruvi / Santana

Median price 259–289 with 12–13 LTM — worth validating

RANKED SHORTLIST — WHERE THE PROXIES POINT (NEIGHBOURHOODS ≥100 LISTINGS)						
NEIGHBOURHOOD	LISTINGS	MEDIAN REVIEWS LTM proxy	MEDIAN REVIEWS / MO	MEDIAN AVAIL. 365 proxy	MEDIAN PRICE	SIGNAL
Sé	517	17.0	2.53	312	263	Top demand proxy
Santana	571	16.0	2.11	238	289	Tightest + strong
Barra Funda	567	13.0	2.00	290	340	Strong
Brás	847	13.0	2.03	328	286	Strong · lower price
Tucuruvi	244	12.0	1.73	319	259	Strong · value
Vila Guilherme	171	11.0	1.56	299	323	Above avg
Consolação	1,927	10.0	1.82	280	332	Scale + balance
República	3,711	10.0	1.76	316	268	Scale
Santo Amaro	1,862	8.0	1.51	274	331	Tight calendar
Composite rank = average of (median reviews LTM ↓, median reviews/month ↓, median availability ↑ tightness) among 70 neighbourhoods ≥100 listings. City median reviews LTM = 7.						

Read as: “If you must prioritize where to validate with real bookings next, start here.” **Not** “these are the most profitable markets.” Price is listed, not realized; no revenue or cost in file.

Left: top composite by median reviews LTM. Right: median availability vs reviews — red = neighbourhood medians; tight + high = stronger proxy.

Bubble size = listings, colour = tightness (darker = tighter). Low-price + high-review pockets merit booking-data validation.

WHAT THIS FILE SUPPORTS VS WHAT IS ONLY A HYPOTHESIS

SUPPORTS A DECISION NOW

Where to sample first for booking-data joins — Sé, Santana, Barra Funda, Brás lead on review proxies.

ONLY A HYPOTHESIS TO TEST

“These neighbourhoods are more profitable or have higher occupancy.”

SUPPORTS A DECISION NOW

ONLY A HYPOTHESIS TO TEST

Where calendar tightness is worth studying — Santana (238d), Santo Amaro (274d), Consolação (280d) are relatively tighter vs city 314d.

“Tighter availability means higher revenue.”
(Could be owner blocks / short windows.)

Scale for piloting ops — República, Consolação, Jardim Paulista, Pinheiros offer large pools with above-median proxies.

“Higher reviews/month proves better guest experience.” (Rating not in file.)

Price positioning to validate — e.g., Sé/Brás/Tucuruvi at lower listed medians with high review proxies.

“Lower listed price causes higher demand.”
(Causality not identifiable here.)

EVIDENCE GAPS & CAVEATS — STATE THESE IN THE MEETING

- **Reviews = proxy, not bookings.** Review propensity varies by guest, host nudging, and stay length. LTM and per-month rates undercount true stays.
- **Availability ≠ occupancy.** availability_365 is forward calendar openness; blocked or unlisted days also read as unavailable. Do not infer vacancy.
- **No financials.** No realized ADR, occupancy rate, cleaning/fee costs, cancellation or length-of-stay — profitability cannot be concluded.
- **No quality or risk fields usable.** license is 100% blank; ratings, cancellations, photo scores absent — do not infer legality or quality.
- **Listing age absent.** New listings depress median reviews; survivor bias inflates mature areas.
- **Neighbourhood size matters.** Small bases (e.g., Pari n=54, 11 LTM) are fragile — briefing ranks only ≥100 for stability; see appendix for ≥50.

Next step to graduate from proxy to proof: join nights-booked, realized revenue, and listing age for Sé / Santana / Barra Funda / Brás / Tucuruvi / República / Consolação and re-estimate occupancy, RevPAR, and margin before any expansion or pricing decision.

Method: Neighbourhood aggregates on listings.csv only. Strength = composite of median reviews LTM, median reviews/month, and inverse median availability (≥100 listings). All measures are descriptive of the file.
