

ELIGIBILITY: NEIGHBOURHOODS ≥100 LISTINGS · 41 AREAS · LISTINGS.CSV ONLY · NO EXTERNAL DATA

Re-ranked São Paulo neighbourhoods — your 40 / 30 / 20 / 10 scoring model

Reviews LTM and calendar tightness (365 – availability) are proxies for demand/tightness — not occupancy. Higher listed price treated as pricing-power signal per your instruction. All norms are min-max across the 41 eligible neighbourhoods; higher = better. Does not prove profitability, quality, or legality.

Exact formula: $Final = 0.40 \times Reviews_norm + 0.30 \times Tightness_norm + 0.20 \times Price_norm + 0.10 \times Scale_norm$

Normalizations: $Reviews_norm = (median_reviews_LTM - 1) / (17 - 1) \times 100$
 $Tightness_norm = (tightness - 2) / (133 - 2) \times 100$ where $tightness = 365 - median_avail$
 $Price_norm = (median_price - 171) / (534 - 171) \times 100$
 $Scale_norm = (listings - 105) / (4382 - 105) \times 100$

Mins/maxes are observed across eligible set only. Scores 0–100; higher is stronger on this model.

Reviews LTM

min 1.0 (Vila Prudente etc) · max 17.0 (Sé)

Tightness

min 2 (Itaquera/Perus) · max 133 (Morumbi 232d avail)

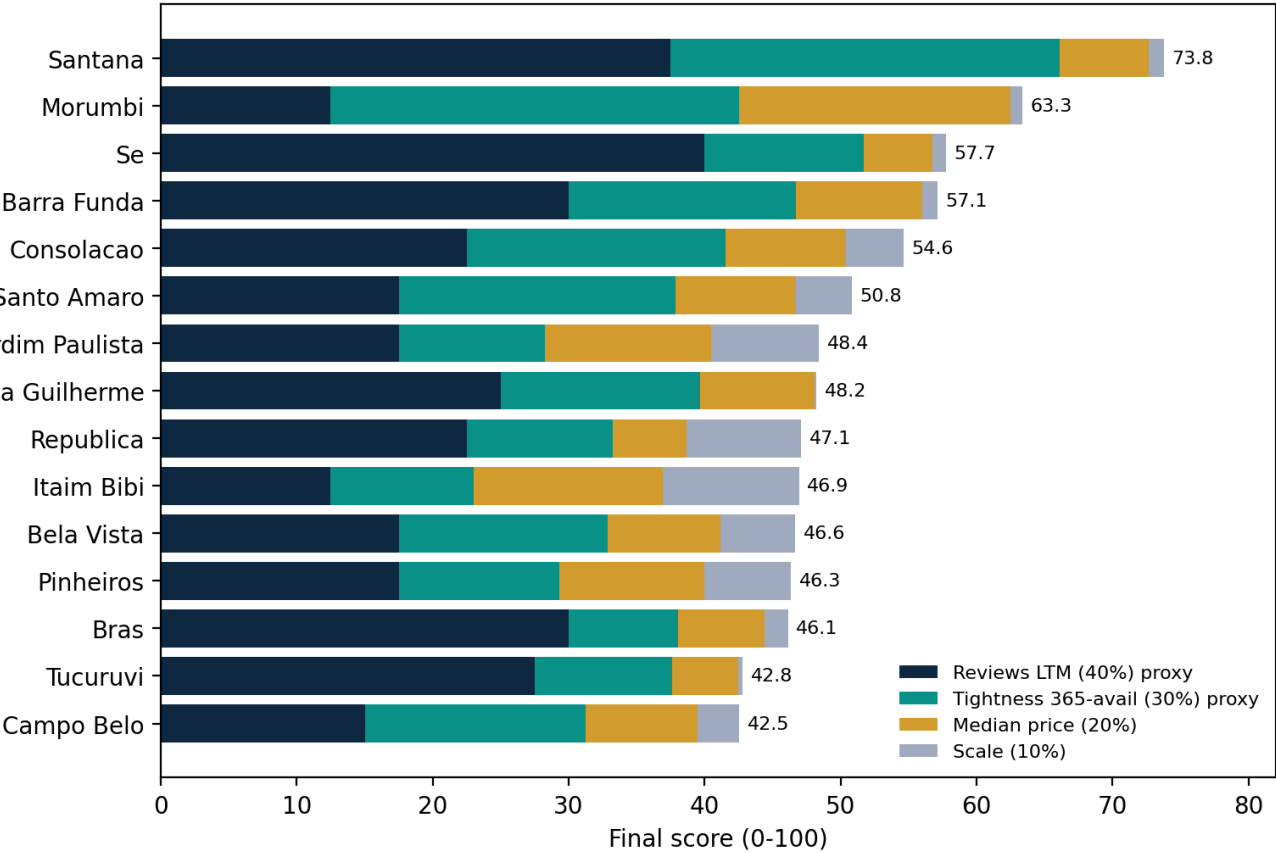

Median price

min 171 (Grajaú) · max 534 (Morumbi)

Scale

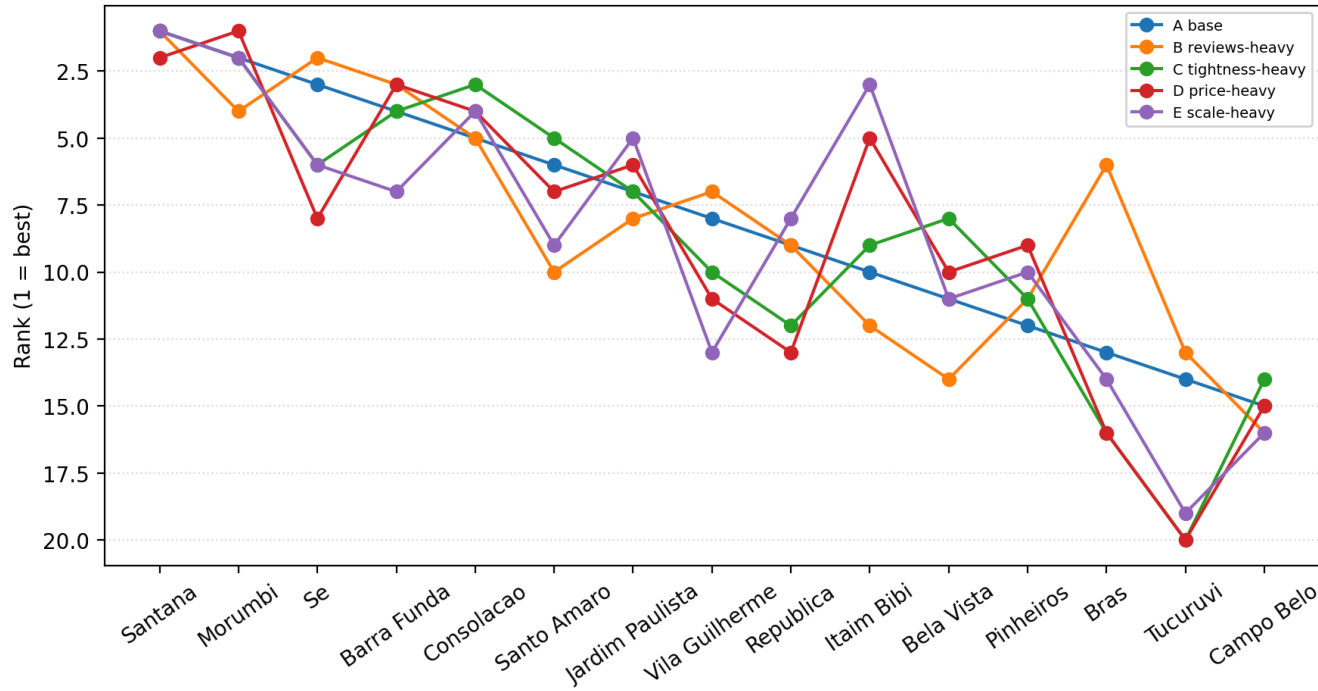

min 105 · max 4,382 (Itaim Bibi)

Top 15 by your 40/30/20/10 scoring model — component contributions

Stacked contributions for top 15; reviews proxy (navy) dominates Sé/Santana/Brás.

Sensitivity: how top 15 move across weight scenarios

Top 15 on your model (A base) — with normalized components
